Table 1: Peer-Review Evaluation Summary

1 Summary

Briefly summarize your understanding of the paper's problem, approach, hypotheses, main results, and conclusions.

1.1 Introduction & Related Work

Does the paper clearly describe the problem setting?

Yes

The abstract could benefit by a short summary of the trade offs, such as which model is more exact, less complex, more interpretable, etc.

Does the paper clearly motivate the problem and make it more interesting to readers?

Yes

Does the paper include a sufficient amount of relevant prior work?

No, a short background of the Ising model, particularly the physical phenomenon that it is modeling, would help make the model less abstract.

The paper could benefit from a short summary of how and in what settings these different modeling methods are typically employed.

Are the paper's contributions clearly stated?

Yes

Is prior work sufficiently compared and contrasted with the paper's contributions?

It is not clear which of these models have already been formulated, and which are new. No in-text references are provided.

1.2 Problem Statement

Does the paper have a clear problem statement?

Yes

Is the problem statement sufficiently mathematically formulated?

Yes

Is enough mathematical background given to formulate and understand the problem statement?

Yes

Does the paper clearly state one or more hypotheses?

Yes

Does the paper outline experiments to support or refute the hypotheses?

Yes

1.3 Results

Does the paper have convincing results?

Yes

Are the results novel?

They appear to be, though references are not provided confirming which models are novel. The analysis and comparison of the models is a good contribution on its own.

Does the paper provide convincing evidence to support or refute the hypotheses?

Yes

Are the simulations / experiments thorough and rigorous?

Yes

1.4 Conclusions

Does the paper discuss how the results support or refute the hypotheses?

Yes

Does the paper thoroughly discuss avenues for future work?

Yes

1.5 Professionalism

Does the paper use a standard template from a professional society?

Yes

Is the paper organized with standard sections?

Yes

Is the paper clearly written?

Yes

Are the contributions clearly outlined?

Yes

Is the hypothesis clearly stated?

Yes

Is the paper well-written and free of grammatical / spelling errors?

- The abstract seems to have rendered incorrectly, causing abnormal letter spacing in a few spots

Do any parts of the paper look or feel like low quality “AI slop”?

No

Does the paper include a detailed disclosure on the use of AI?

No

Is the length of the paper at least 6 pages with no more than 2 pages of references?

Yes
